

EMIR BEKRIJA

ABOUT ME

I am passionate about Information Technologies, constantly learning new skills in software development and embedded systems. My focus is on creating practical solutions that make a difference.

PROGRAMMING

LANGUAGES:

C: Upper Intermediate

C++: Upper Intermediate

Python: Upper Intermediate

Java: Intermediate

C#: Below Intermediate

Solidity: Intermediate

JavaScript: Intermediate

Kotlin: Beginner

Golang: Beginner

DATABASES:

SQL: Upper Intermediate

MongoDB: Intermediate

EDUCATION

2022–2025

International Burch University

Bachelor of Science in Information Technology – Graduated

2025–2027

International Burch University

Data Science – Master

EXPERIENCE

Animal-10 Image Classification with CNNs

Built and trained a deep learning model for multi-class animal species recognition using the Animal-10 dataset. Implemented data preprocessing and augmentation, constructed a CNN architecture in TensorFlow/Keras, and applied modern techniques to improve model generalization. Performed evaluation through accuracy curves, confusion matrices, and multi-class classification metrics, showcasing applied skills in computer vision and supervised learning.

NLP Sentiment Analysis

Conducted a Natural Language Processing (NLP) project focusing on sentiment analysis of Twitter comments. Preprocessed data, applied tokenization, and used machine learning models to classify sentiments. Analyzed results to extract insights into user opinions and trends.

July 2025 - August 2025: IT Team Member – Sarajevo Film Festival

Worked as part of the **IT team**, contributing to the design and development of multiple festival systems that supported invitations, accreditations, and venue access:

-**Invitation System** – Developed using Angular and Firebase for managing guest invitations.

-**Accreditation System** – Built with Angular and Firebase, integrated with Mailjet for sending digital accreditations.

-**Scanner App** – Created an access control system with Angular + Firebase backend, and a Flutter + Firebase mobile app for scanning tickets and managing event check-ins.

INTERESTS:

Programming • Web Development •
Embedded Systems • Machine
Learning • Data Science • Game
Development

SOFT SKILLS:

Problem Solving • Communication •
Leadership • Teamwork • Time
Management • Presentation Skills •
Creativity

December 2024 - February 2025:

Internship - Software Engineering Intern at Planika

Developed a **Helpdesk System** to streamline customer support and issue tracking for Planika. Built the system using PHP (FlightPHP framework), JavaScript, and SQL, implementing a ticketing system that allowed users to report issues, track progress, and communicate with support staff. Designed a database structure for efficient issue categorization and resolution tracking, improving customer support response times.

March 2024 - June 2024: **Programming 2 Demonstrator**

At International Burch University, I taught C++ to fellow students, guiding them through programming concepts and ensuring they grasped complex programming techniques through hands-on practice and real-world examples.

PROJECTS

Smart Price Tracker – Senior Design Project

Developed a **web scraping system** that collected product prices from multiple e-commerce websites and compared them to detect potential misleading sales practices. Implemented **BeautifulSoup and Selenium** for data extraction, stored results in an SQL database, and built a **web dashboard** using jQuery and PHP to display the latest price trends and comparisons.

Real Estate Marketplace

Developed a full-stack web application for a real estate marketplace, utilizing system analysis and project management methodologies to ensure the project adhered to all specifications and requirements.

Mobile Field Booking App

Developed a mobile app using Kotlin, Jetpack Compose, and SQLite, which allowed users to upload and rent sports fields. This project was part of the Introduction to Mobile Programming course.

Secure System Development

Developed a secure login/sign-up system using OWASP Top 10 standards for the Secure Software System Development course. Implemented secure PHP APIs and ensured the app followed modern security practices.

Blockchain Digital Library

Built a digital library platform using Solidity for blockchain functionality. The app allowed users to upload, buy, and sell books on the blockchain. As an admin, additional features were available, such as managing users and viewing transaction history.

Website Testing

Tested the Cinestar website as part of the Software Verification, Validation, and Testing course. Utilized Selenium for automated testing to detect bugs, ensure consistency, and verify site functionality.
